TECHNICAL TIP ZEN # 24
CARING FOR THE STARTING MOTOR

To improve the life of your starter motor, ZEN has prepared some basic tips on what you should not do and what might happen in these cases:

Apply excessive grease in the splines or starter armature or apply oil in the splines or bushing

The excess grease/oil might contaminate the special grease inside the parts, causing malfunction

Wash the starter drive

The grease inside the starter drive can be removed

Modify the product features or change the components of the starter drive, unless advised

This compromises the durability of the starter drive

Keep turning the key to start the car for a long time

The bushing of the starter drive might wear off

Try to start the car with the engine still running or start the vehicle with the gear engaged

The teeth of the starter drive might break or wear off / Completely damage the freewheel of the starter drive

Try a second start before 30 seconds

It may damage the electrical part of the starter motor
